

THE BONDER

THE ESSENTIAL LINK BETWEEN PREP & PRODUCT

Preparation Creates the Surface. The Bonder Creates the Link.

Preparation matters, and **The Bonder by Tayla-Made Nail Co** is the essential bonding step between your prepared natural nail and your chosen Tayla-Made gel system.

Designed to promote adhesion between the natural nail plate and the product applied over it, The Bonder creates the crucial link between your nail preparation and product application.

Used after **The Dehydrator**, The Bonder is applied to the prepared natural nail plate before any Tayla-Made core gel product that requires adhesion to the natural nail.

Whether you're applying **The Base Colour, The Base, The Foundation or The Builder**, if your Tayla-Made gel product is being applied to the natural nail plate, **The Bonder comes first.**

After application, The Bonder air sets and forms an **adhesion-promoting film** on the natural nail. The surface will remain tacky - this is exactly what you want. This tacky adhesive film is ready for the Tayla-Made gel product that follows.

No UV or LED curing is required for The Bonder.

WHY BONDING MATTERS

Preparation Creates the Surface. The Bonder Creates the Link.

Successful retention isn't achieved through one product or one preparation step. Each stage has a specific purpose.

Once true cuticle has been removed and the natural nail plate has been properly prepared, The Dehydrator temporarily removes surface moisture and oils.

The nail plate is now clean, dry and ready for the next stage. **This is where The Bonder comes in.**

The Bonder is an adhesion-promoting product designed to create the essential link between your prepared natural nail plate and the Tayla-Made gel product applied over it.

Prepare > Dehydrate > Bond > Apply

PRESERVE THE NATURAL NAIL

Better Adhesion Doesn't Need to Mean More Filing

At Tayla-Made Nail Co, our approach to preparation is simple:

Achieve the adhesion you need while preserving as much of the natural nail as possible.

The purpose of nail preparation isn't to aggressively file away layers of the natural nail plate in an attempt to make product stick. Every unnecessary pass of a file removes a little more of the natural nail.

Instead, our preparation system uses products with specific jobs. The Cuticle Remover assists in removing true cuticle and non-living tissue. The Dehydrator temporarily removes surface moisture and oils. The Bonder promotes adhesion between the prepared natural nail plate and your Tayla-Made gel product.

Together, these preparation steps help create the foundation needed for product adhesion while supporting our philosophy of preserving the integrity of the natural nail wherever possible.

WHY THE BONDER?

1 PROMOTES ADHESION Creates the adhesion-promoting link between the prepared natural nail and the gel product that follows.	2 ESSENTIAL BEFORE GEL Apply first whenever a Tayla-Made core gel product is being applied directly to the natural nail plate.	3 WORKS WITH THE DEHYDRATOR The Dehydrator prepares the surface. The Bonder creates the adhesion-promoting layer.
4 TACKY & READY Forms an adhesive film as it air sets. The surface remains tacky - do not wipe.	5 NO LAMP REQUIRED The Bonder air sets. No UV or LED curing is required.	6 PRECISION BRUSH Curved/rounded brush for a thin, controlled application.

The Bonder forms the adhesive film. Tacky means ready.

HOW TO USE

1

PREPARE

Ensure true cuticle and non-living tissue have been thoroughly removed from the natural nail plate. Complete any additional preparation required for your chosen nail service.

2

DEHYDRATE

Apply The Dehydrator to the exposed natural nail plate and allow it to air dry completely. The nail plate should appear chalky and dry. Avoid touching the prepared nail plate.

3

APPLY THE BONDER

Using the curved/rounded precision brush, apply a thin, controlled layer of The Bonder to the natural nail plate. Avoid unnecessary contact with surrounding skin.

4

ALLOW TO AIR SET

Allow The Bonder to air set. As it air sets, it forms an adhesion-promoting film on the natural nail. The surface will remain tacky once ready. **Do not wipe.** No UV or LED curing is required.

5

APPLY YOUR TAYLA-MADE GEL PRODUCT

Once The Bonder has air set and reached its tacky stage, continue directly with your chosen Tayla-Made core gel product: The Base Colour | The Base | The Foundation | The Builder.

That tacky adhesive film helps create the link between the natural nail and the Tayla-Made gel product applied over it.

USING THE BONDER DURING AN INFILL

During an infill or rebalance service, The Bonder is primarily required where fresh natural nail growth is exposed.

After completing your preparation, apply The Dehydrator and The Bonder to the exposed natural nail regrowth.

There is generally no need to coat the entire existing enhancement with The Bonder because that product is already bonded to the nail.

Concentrate application on the natural nail regrowth, with only minimal overlap onto properly prepared existing product where necessary.

WHERE IT FITS IN YOUR PREP

When using the complete Tayla-Made preparation system:

1	THE CUTICLE REMOVER Softens and assists with removing true cuticle and non-living tissue from the nail plate.
2	THE DEHYDRATOR Temporarily removes surface moisture and oils from the natural nail plate.
3	THE BONDER Creates the adhesion-promoting link between the prepared natural nail plate and your Tayla-Made gel system.
4	YOUR CHOSEN TAYLA-MADE CORE PRODUCT Apply The Base Colour, The Base, The Foundation, The Builder or your chosen Tayla-Made system.

Prepare > Dehydrate > Bond > Apply

WHY YOU'LL LOVE IT

• Promotes adhesion between the natural nail plate and your Tayla-Made gel system	• Creates the essential bonding step between preparation and product application
• Used after The Dehydrator	• Recommended before all Tayla-Made core gel products applied to the natural nail
• Helps support product retention	• Supports a preparation system designed to minimise unnecessary filing of the natural nail
• Air sets and forms an adhesion-promoting film	• Remains tacky and ready for your gel product
• No UV or LED curing required	• Curved/rounded precision brush for controlled, precise application
• Suitable for full sets and infill services	• Designed specifically for application to the natural nail plate
• An essential part of the Tayla-Made preparation system	• Professional 15ml bottle

PROFESSIONAL TIPS

TACKY MEANS READY

Unlike The Dehydrator, which air dries leaving the nail plate chalky and dry, The Bonder should remain tacky.

As The Bonder air sets, it forms an adhesion-promoting film on the natural nail. Once this film has formed and the surface is tacky, **don't wipe it away.**

That tacky adhesive film is ready for your Tayla-Made gel product to be applied directly over it.

Tacky is not unfinished. Tacky means the adhesive film is ready.

NATURAL NAIL = BONDER

An easy way to remember where The Bonder belongs is:

If fresh Tayla-Made gel product is going onto the natural nail plate, apply The Bonder first.

During a fresh application, this generally means the entire prepared natural nail plate.

During an infill, concentrate The Bonder on the exposed natural nail regrowth rather than unnecessarily coating the entire existing enhancement.

THE TAYLA-MADE PREP PHILOSOPHY

Remove What Shouldn't Be There. Preserve What Should.

Great retention shouldn't require sacrificing the health and integrity of the natural nail.

Our approach is to remove what can interfere with adhesion - true cuticle, surface moisture, oils and contaminants - while preserving as much of the healthy natural nail plate as possible.

The Cuticle Remover > The Dehydrator > The Bonder

Three products. Three different jobs. One carefully considered preparation system.

Because great nails don't start with the colour. They start with the prep.

AT A GLANCE

Product	The Bonder
Purpose	Promotes adhesion between the prepared natural nail plate and the Tayla-Made gel system
Size	15ml
Bottle	Luxe matte white
Lid	White
Application	Curved/rounded precision brush
Used On	Prepared natural nail plate
Air Set	Yes
Adhesive Film	Forms an adhesion-promoting film as it air sets
Finish	Tacky - do not wipe
UV/LED Cure Required	No
Used After	The Dehydrator
Used Before	Tayla-Made core gel products applied to the natural nail
Suitable For	New applications and natural nail regrowth during infills
Primary Role	The essential adhesion-promoting link between the natural nail and your Tayla-Made gel product

The essential link between prep and product.
